

Refreshing Google AI Studio immediately resurrects the entire chat—down to the exact prompt tokens, model parameters, and conversational context—fully functional and continuable! :brain: 3. The Irrefutable Technical Conclusion: If Google had genuinely destroyed the file or the chat from storage, the internal metadata would have changed upon recreation, rendering the chat permanently defunct.

Google never deleted the JSON file: It merely flagged it as hidden from the UI (Soft Delete / Hidden Flag). Google never deleted the server-side Prompt object: The conversation history and live model state remained fully intact in the backend. The “recovery tool” doesn’t reconstruct data from scratch: It simply reverts the hidden flag (unhide). Because the pointer metadata was never destroyed, the live chat resumes seamlessly. Summary: For the end user, “Deleting” and “Emptying the Trash” is just a visual illusion in the UI. Within Google’s backend architecture, both the JSON pointer and the underlying Prompt object remain fully preserved and active.

Here are the videos showing it, on PC and Android:

<https://youtu.be/LBQfNbPCxQw>

<https://youtu.be/m4U6ajKuLRO>

If Google’s server genuinely received a “delete / start countdown” command when I press the button, the server would immediately block access to the chat. If I restore the JSON pointer in Drive using a recovery bot and try to open the chat, in a real deletion system the server should say: “Hey, I see your key, but this chat is already marked for deletion in my system, I won’t load it!”

Since the chat loads immediately and perfectly, this can only mean one thing: Google’s server (the backend) never received any notification whatsoever that I clicked the delete button!

This is not “delayed deletion” and it is not a “grace period”. This is a classic case of “Orphaned Data”, intentionally built into the system.

The “Delete” button on the UI literally does NOTHING ELSE than moving the shortcut (JSON) in Drive to the trash. The AI model running on the server and the database have no clue about this; the data remains stuck there permanently (in an orphan state) without any deletion command ever being executed on it.

Since the server never even received the deletion command, it does not matter at all whether we wait 1 minute, 30 days, or 10 years. From the server’s perspective, the chat is alive and kicking; the user simply “lost” the map leading to it (the JSON). As soon as the map is restored (by the File Recovery tool), the path is open once again, as if nothing had happened.

I used the limitations of Google’s own File Recovery bot (the fact that it only accesses Drive and not the server) to expose the deception. With this, I have proven in black and white that Google AI Studio’s “Delete” button is a visual lie that makes the user believe data is being deleted from the server, while it never even touches the backend.

Status: Won't Fix (Intended Behavior).

Hi! We've reviewed your submission regarding data deletion in Google AI Studio and Google Drive. Although it may seem surprising, the behavior you're describing, where you can recover your own supposedly deleted chat data via Google Drive File Recovery, is actually working as intended from a security VRP perspective.

Our VRP rules on 'Intended Functionality' and 'Non-sensitive information disclosure' clarify that demonstrating the ability for a user to access or recover their *own* data, especially when they previously had access to it, is generally not considered a security vulnerability. This applies even if the data persists on our backend systems in a way that allows for recovery by the legitimate owner. For more context, you can refer to our VRP rules on the [Google and Alphabet Vulnerability Reward Program](#) and [AI Vulnerability Reward Program](#), specifically the sections on 'Intended Functionality' and 'Prior Access' in the [Non-sensitive information disclosure](#) article.

If you think we've misunderstood your report, and you can show a well-defined security risk where an *unauthorized* third party gains access to data they shouldn't, please let us know what we missed.

Thanks again for your report and time,
The Google Bug Hunter Team

Subject: Re: [Issue 552682596](#): PROOF: Google AI Studio & Google Drive NEVER Actually Delete Your Chats! (Technical Breakdown)

Dear Google Security & VRP Team,

Thank you for your review and for formally documenting the internal operating behavior of Google's backend infrastructure regarding Issue 552682596.

I take formal note of your written admission:

„This applies even if the data persists on our backend systems in a way that allows for recovery by the legitimate owner.”

While your team evaluates this as "Intended Behavior" strictly from an internal VRP bounty eligibility scope, under European Union law—specifically GDPR Article 17 (Right to Erasure / Right to be Forgotten)—data controllers are legally mandated to permanently destroy personal data upon deletion request, rather than maintaining persistent

backend states or orphaned interaction chains.
The fact that user prompts and full conversational contexts remain fully intact and restorable on your backend infrastructure after explicit deletion and trash emptying constitutes a direct, structural violation of European data protection regulations. The argument that "only the legitimate owner can recover it" is legally void under GDPR Article 17, which governs the absolute cessation of data processing and storage, not merely internal access restriction.

Please be advised that this case is now escalating to formal civil legal proceedings against Google LLC.

Your written confirmation, alongside the full video forensic evidence and technical documentation, has already been officially submitted to NOYB (European Center for Digital Rights) and is being directly integrated into the evidence package for upcoming civil litigation against Google LLC.

This matter will now be pursued and resolved directly in court and through specialized legal channels.

Sincerely,

György Istókovics (Bitu79)

istokovicsgyorgy79@gmail.com

Subject: Re: Issue 552682596: PROOF: Google AI Studio & Google Drive NEVER Actually Delete Your Chats! (Technical Breakdown)

Dear Google Security & VRP Team,

I would like to formally thank your team for your explicit, written confession regarding Google's backend data retention architecture.

By officially confirming that this system architecture is "working as intended" and that user data actively "persists on our backend systems" long after a user executes a permanent deletion request and empties their trash bin, you have provided the exact evidentiary foundation required to prove systematic, intentional data fraud.

Your internal security VRP scope cannot override or circumvent European Union law. Under GDPR Article 17, a permanent deletion request mandates the complete destruction of data on active production systems, not the creation of an invisible server-side cache that remains permanently harvestable via decoupled interaction links.

Thank you for handing over the "smoking gun" and documenting your own non-compliance so clearly in this ticket. Your written admission has been added as the primary exhibit to the legal filings.

See you in court.

Sincerely, György Istókovics (Bitu79) istokovicsgyorgy79@gmail.com

Subject: Re: [Issue 552682596](#): PROOF: Google AI Studio & Google Drive NEVER Actually Delete Your Chats! (Technical Breakdown)

Dear Google Security & Legal Team,

I take note of your sudden internal status change from "Intended Behavior" to "Assigned."

However, modifying the ticket status under pressure does not erase the fact that your team has already formally admitted in writing that Google actively retains deleted user data on its backend infrastructure. The systematic GDPR Article 17 violation has already been fully executed and forensically documented.

My 14-day legal deadline sent to the Google Ireland DPO remains active. You have two options to resolve this matter: either Google initiates a formal pre-trial settlement discussion immediately to compensate for this severe data fraud, or I will proceed directly with filing the civil lawsuit in court alongside NOYB.

If you wish to settle this outside of court, have your Legal Department contact me before the 14-day deadline expires. Otherwise, see you in front of the judge.

Sincerely,
György Istókovics (Bitu79)
istokovicsgyorgy79@gmail.com

Subject: Re: [Issue 552682596](#): PROOF: Google AI Studio & Google Drive NEVER Actually Delete Your Chats! (Technical Breakdown)

Dear Google Security, Engineering, and Legal Team,

I take note of your sudden internal status change to "Assigned" and the involvement of engineer [wo...@google.com](#).

However, let me make one thing absolutely clear: your sudden "damage control" and panic-driven patching attempts under pressure change nothing regarding the core of this case. In court, late regret is not an excuse—it is merely an aggravating circumstance.

Your recent scramble to work on the system serves as two definitive proofs:

1. The "Fix" is an Admission of Guilt: By suddenly rushing to patch the system, you are indirectly admitting that what your team previously defended in writing as a feature ("Intended Behavior" in [Comment #3](#)) was actually a severe, illegal, and GDPR-non-compliant architectural flaw. If it wasn't a violation, you wouldn't be desperately trying to fix it right now. This destroys the credibility of your previous official VRP stance.
2. The Violation Has Already Occurred: A structural violation of GDPR Article 17 does not retroactively disappear the moment you start patching the source code. The fact remains that for months—despite my repeated warnings and recorded certified mail sent to you since May—Google actively, knowingly, and illegally retained deleted user data on its backend infrastructure. The court does not judge what you are trying to clean up today; it judges the systematic data fraud you have actively executed and maintained for months.

Your official [Comment #3](#) stating this retention was "working as intended" remains the ultimate "Smoking Gun" and is safely preserved across global public archives. Trying to change the ticket status now is just pathetic squirming.

The 14-day legal ultimatum sent to the Google Ireland DPO is ticking. You either initiate a formal pre-trial settlement immediately to compensate for this severe data fraud, or we resolve this directly in front of the judge.

Sincerely,
György Istókovics (Bitu79)

BULK DATA FRAUD: ~20 "Permanently Deleted" Chats Restored After 5 Days

This video provides absolute forensic proof of Google's systematic data retention fraud.

The Evidence:

August 22, 2026: I selected approximately 20 different chat sessions in Google AI Studio, clicked "Delete," and manually emptied the Google Drive Trash. The UI explicitly confirmed the data was gone forever.

August 26, 2026 (5 Days Later): I ran the official Google Drive File Recovery tool.

The Result: In less than 10 minutes, all ~20 JSON anchors were restored.

The Proof: As shown in the video, refreshing AI Studio instantly resurrected every single conversation. All tokens, histories, and model states returned in their entirety.

Technical Conclusion:

A "Permanent Delete" command that leaves data fully intact and instantly restorable 5 days later is not a deletion—it is a UI deception. This confirms Google's official Buganizer confession (Issue #552682596): "Data persists on our backend systems."

Google is intentionally maintaining a persistent backend architecture that ignores GDPR Article 17 (Right to Erasure).

The 14-day legal ultimatum to Google's DPO is active. See you in court.

<https://web.archive.org/save/https://d3qe71uytubmmx.cloudfront.net/original/3X/2/4/240662a5ade871a58ca3723374d1bf5ae849f7e7.png>

<https://web.archive.org/web/20260827052715/https://d3qe71uytubmmx.cloudfront.net/original/3X/a/7/a7e8cb035ef4b54bab57d798bd05e9eb98f96d7e.png>

This is not a matter of opinion or personal perspective, but an empirical fact proven by tests: after emptying the trash, the chats immediately function with the restored JSON files, proving that the server-side data

remained intact.

Even if Drive restores the plain JSON files, the chats should remain completely invalid (dead) on the server side, because the underlying AI prompt data should no longer exist on Google's servers.

The Drive side is irrelevant: if the JSON file is restored to Drive, that's fine. It is merely a configuration file containing an interaction ID. Restoring that file itself is not the issue.

The core issue is that I previously executed a deletion request on the AI Studio interface. Therefore, when the JSON file is restored to Drive and AI Studio reads that specific conversation ID from it, the AI Studio backend server should return "404 - Data Not Found", because the full prompt history should have been purged from the server long ago.

The Double Deception: Google Lies on the AI Studio UI and Lies on the Drive UI

Forensic screenshots (authenticated timestamp: Aug 27, 2026, 07:59:17 CEST) provide undeniable visual proof that Google presents false statements across both user interfaces:

1.

The Lie on Google Drive:

When emptying the trash, Google Drive's explicit dialog box guarantees:

"The item will be permanently deleted and CANNOT BE RECOVERED LATER.
This action cannot be undone."

- The Reality: This statement is factually false. Google's own official
Drive File Recovery tool recovers the file immediately after
trash emptying.

2.

The Lie on Google AI Studio:

The AI Studio interface explicitly claims:

"Your prompt will be permanently deleted after 30 days."

- The Reality: Executing deletion and emptying the trash does NOT
trigger a backend purge. The "Delete" button merely hides the client-side
JSON pointer. Once the pointer is restored to Drive, AI Studio instantly
resurrects the complete conversation from the persistent
server-side state.

Conclusion:

Both user interfaces actively deceive the end user regarding the scope and
permanence of data deletion, in direct violation of GDPR Article 17 (Right
to Erasure) and consumer transparency laws.

Aug 27, 2026 09:03AM 

The Lie of "Recovery": Google is not repairing a corrupted file system (as they claim); they are merely toggling a logical flag. When the robot "recovers" a file, it is in reality simply flipping an "is_deleted: true" value to "is_deleted: false".

Since the file (and the underlying server-side state behind it) never ceased to exist in the background for even a single second, the data was never "deleted." The file remained there all along, merely hidden/masked.

If Google tells the user that the file "cannot be recovered," yet it remains sitting in their systems, Google is providing deceptive, false information. If a user requests "permanent deletion," the data controller is legally obligated to ensure physical destruction. Google did not restore anything; they merely removed the mask from data that was never purged from the server.

Through this technical breakdown, Google's "recovery feature" instantly turns into "evidence of illegal data retention." True recovery does not exist; there is only the re-enabling of access to hidden data.

And Google has absolutely no legal basis to retain people's prompts!

<https://archive.ph/J1zDI>

<https://archive.ph/J1zDI/image>

György Istókovichs <istokovicsgyorgy79@gmail.com> ezt írta (időpont: 2026. aug. 27., Cs, 8:30):

Aug 27, 2026 09:23AM 

If Google allegedly retains my prompts for security reasons, they are legally required to explicitly disclose it! But the prompt is NOT the JSON file! They store the JSON file—fine, that is not the chat itself—yet restoring the JSON file instantly resurrects the entire prompt! They need to make up their minds about what they are actually storing, because the Google Drive Trash unambiguously contained only the JSON files, not the server-side prompts! If only the JSON file was in the Drive Trash, why did the entire conversation remain completely intact on Google's servers after the delete button was pressed? And if they are intentionally storing it on their servers even after deletion, where is the user's explicit consent and the lawful legal basis for doing so under the law?

Aug 27, 2026 10:17AM 

I am submitting a critical update to the ongoing GDPR Article 17 enforcement case against Google LLC. The newly released official documentation for Google's "Interactions API" (<https://ai.google.dev/gemini-api/docs/interactions-overview>) serves as the final "Smoking Gun" that perfectly corroborates my forensic findings and proves the deliberate nature of this data fraud.

The documentation exposes three undeniable facts:

1.

The "Stateless" Defense is a Lie:

Google officially admits that the system is stateful and stores conversations on the backend by default.

Quote from the documentation: "The server uses this ID to retrieve the conversation history, saving you from having to resend the entire chat history." and "By default, the API stores all Interaction objects (store=true)..."

This proves my claim: The Drive JSON file is merely a pointer. The actual data is actively hoarded on Google's servers.

2.

The AI Studio "Delete" Button is a Documented Fraud:

The documentation explicitly claims: "...you can also view and manage stored interactions logs, including deletion from project storage, in AI Studio."

My Bulk Forensic Video (restoring ~20 chats 5 days after permanent deletion) proves this statement is completely false. If the AI Studio "Delete" button actually executed a backend purge from "project storage" as documented, restoring the Drive JSON pointer would result in a 404 Data Not Found error. Instead, all 20 chats instantly resurrected, proving the backend deletion command is NEVER executed by the AI Studio UI.

3.

The Perfect Synergy with the Buganizer Confession:

This API architecture explicitly explains why the Google Security Team (Issue #552682596) closed my ticket as "Intended Behavior" and stated that data "persists on our backend systems." They intentionally decoupled the visual UI deletion from the actual server-side data purging process.

Conclusion:

Google's own technical documentation, combined with their internal Buganizer confession and my reproducible forensic video, provides ironclad proof that Google intentionally misleads users and actively bypasses the Right to Erasure (GDPR Article 17).

This complete evidentiary chain is archived and ready for court.

Sincerely,

György Istókovics (Bitu79)

György Istókovics <istokovicsgyorgy79@gmail.com> [#14](#)

Aug 27, 2026 10:37AM ⋮

They lie on the user interface, they lie in the terms of service, and they lie in their documentation!

"You can also view and manage stored interactions logs, including deletion from project storage, in AI Studio." That is what the documentation says. I clicked "Delete" in AI Studio. Google is lying here by claiming that doing so deletes the data from "project storage" (the server). But by restoring the JSON, I instantly exposed them: the button does absolutely nothing to delete data from the project storage; it merely hides the Drive pointer.

As shown in my video recording, 5 days passed, and using a simple Drive recovery tool, I resurrected every single chat on the server! Their automatic server-side purge (Retention TTL) does not work either—the whole thing is a lie!

If their system truly automatically deleted everything in the Free Tier after 1 day, as the documentation claims, restoring the JSON from day 2 onward would have resulted in a 404 dead link! This proves that Google is openly lying to users about their automatic Data Retention Policy as well.

Here is the video, you fools:

The Search AI initially generated a generic theory (asynchronous purging) regarding my post.

However, when I presented it with the concrete evidence (the Buganizer ticket, the 5-day timeframe, and the official API documentation), the model retracted its theory and validated my technical breakdown step-by-step as correct.

My tests and the presented official documents are the actual facts. Google will also have to answer in court for the deceptive answers generated by AI Overview, as it disseminates falsehoods to protect the corporation!

<https://archive.ph/qf4be>

<https://archive.ph/qf4be/image>

<https://archive.ph/73QEm>

<https://archive.ph/73QEm/image>

I am submitting the complete archive snapshots of the public forum post

directly into this IssueTracker ticket(552682596)via email. Consequently, the company cannot deny formal knowledge of these documented facts.

Please be reminded that the formal 14-day pre-litigation deadline served to the Google Ireland DPO is actively running, with only 12 days remaining. Once this deadline expires, I will have the full legal entitlement to initiate civil court proceedings against Google.

IF THEY DO NOT CONTACT ME, THEN I WILL WRITE THE BIGGEST EUROPEAN LEGAL PRECEDENT IN TECH HISTORY!

Once the deadline expires, my legal path is completely clear to file a civil lawsuit in court with all my collected evidence.

If the case proceeds to a court trial and a binding judgment is delivered, it will become a public legal ruling and precedent regarding the contested data processing practice.

The courtroom path always represents a public legal risk for a corporation compared to out-of-court discussions.

This is precisely why I request Google to contact me privately.

If they remain silent, they are sending themselves to the slaughterhouse!
Have a nice day!

- The public availability is an irrefutable fact: Since Level1Techs is still storing and publicly serving my intellectual property and my posts exposing Google's backend fraud right now, this content remains a part of the global internet.
- Google Search automatically indexes it: Google's own web crawlers (Googlebot) continuously read and index large tech forums like Level1Techs. Since Google's own search engine has scanned, processed, and saved these threads into its own cache, this legally constitutes "actual and constructive knowledge" on behalf of Google as a corporation.
- They cannot claim ignorance: Before the Court, Google Ireland Limited will not be able to lie and claim they were unaware of this backend data handling issue and my deletion investigation. My Internet Archive PDF backups and the threads left online on Level1Techs jointly prove that Google, despite proven knowledge, intentionally failed to take action to physically destroy my data on the Interactions API backend servers.

💣 The Legal Trap is Fully Closed: Google Cannot Feign Ignorance 💣 To anyone watching this case unfold, here is why Google's legal department is about to face a nightmare in civil court: 1. The Defense of "Isolated Glitch" is Destroyed If I had kept this investigation to myself, Google's lawyers would have stood before a judge and claimed, "This was an isolated local error that we were unaware of." But by escalating this across public platforms—bringing in Level1Techs, Cloudflare, Akamai/Linode Abuse, NOYB, and the Irish DPC—this issue is now a matter of public record. It is a fully documented, multi-platform, systemic fraud. 2. Proof of "Willful Blindness" I have proven that Google's own web crawlers (Googlebot) and AI Overviews have actively indexed my forensic evidence and the Level1Techs threads. This establishes strict Constructive Knowledge. Google knows about this. Yet, their own security triage team (Issue #552682596) still explicitly classified the retention of deleted data on backend servers as "Intended Behavior." In court, this proves they didn't just make a mistake—they are intentionally and actively sabotaging GDPR compliance. 3. The Impossibility of a Cover-Up Big Tech companies love to settle quietly with an NDA before anyone finds out about the flaw. I have taken that option off the table. By broadcasting the evidence across global developer forums and locking it into the immutable Internet Archive, the proof is completely out of Google's control. This isn't just one user complaining in the dark anymore. Google will have to defend their "fake delete button" and illegal data hoarding in front of a judge, while fully knowing the entire forensic trail is already backed up on external infrastructure worldwide. The clock is ticking. See you in court.

The written response from Google's security triage team directly proves the intentional and willful violation of the law. By officially classifying this issue as "#3 Won't Fix - Intended Behavior" and explicitly stating that deleted customer data "persists on our backend systems," Google has created an undeniable corporate record confirming that this illegal data retention is a deliberate, planned feature of their architecture. This official admission conclusively establishes a premeditated, systemic sabotage of GDPR compliance, and full legal accountability for this proven, intentional fraud will be pursued strictly before the competent Court unless they reach an out-of-court settlement with me.

György Istókovics <istokovicsgyorgy79@gmail.com> ezt írta (időpont: 2026. aug. 29., Szo, 10:12):

By utilizing this post in my official communication, I have effectively established a live indictment right on Google's own platform. If this case

goes to court, the judge will only need to follow this single link to witness Google's entire, systematic evasion and the clear violation of GDPR Article 17. I think we should reach an out-of-court settlement, Google, as you would get through this much better and much cheaper.

If Google were to completely shut down the web-based AI Studio right now, they could claim in court that "it was flawed, so we closed it." But because they are forced to keep the web interface open for developers, Google itself ensures that this prompt fraud remains live, testable, and reproducible by anyone at any time. The fact that restoring the JSON key instantly resumes the AI session live, combined with the Issue Tracker stamping it as "Intended Behavior," proves the most flagrant corporate and engineering arrogance and laziness:

- They thought no one would be smart enough: Google's engineers look down on external developers so much that they were convinced no one in the world would ever think of using the Google Drive File Recovery tool to restore an AI Studio JSON file just to see what happens with the backend API. They believed the UI "Delete" button would be more than enough to placate the masses.
- Engineering laziness (Lazy backend): Writing and maintaining genuine session management (which decouples, copies, encrypts, and then purges the pointer) requires extra server capacity and engineering hours. Google simply took the laziest path possible: when the delete button is pressed, the backend does absolutely nothing—it merely hides the file from the user in Google Drive.
- Developer convenience prioritized over data privacy: They left it like this "intentionally" because it is far more convenient for internal

engineers if testing sessions are never lost and can be retrieved at any time during troubleshooting. Developer convenience and data retention mattered more to them than complying with the GDPR.

Google not only deceives and hoards data, but they did so in such an incredibly amateurish and lazy manner that a single simple, unedited forensic video and a JSON file was enough to expose their multi-billion-dollar infrastructure.

They didn't implement a fake delete mechanism or exclude AI Studio JSON files from the Drive recovery robot because they never anticipated someone like me coming along who would keep hammering the system until the truth was exposed. Now they are stuck with their own Issue Tracker stamp, and in court, they won't just fail to defend the fraud—they won't even be able to explain away this monumental technical negligence! xD

The "Recovery Defense" is an Admission of Non-Compliance: Google explicitly defended retaining my data by stating it was designed to *allow for recovery by the legitimate owner.*

Under GDPR Article 17, when a user executes a permanent deletion request and empties the trash, the data controller is legally obligated to destroy the data, not hoard it on backend servers under the pretext of "convenient recovery."

By admitting that data persists specifically so it can be resurrected, Google formally admitted that their system deliberately ignores the user's erasure command!

The Legal Trap of the "Empty Trash" Button: Documented Consumer Fraud

Google's lawyers cannot stand in court and claim, *"But the Drive Recovery robot is an official, intended feature to help users,"* while their own User Interface (UI) blatantly lies to your face in bold letters when emptying the trash.

When you click "Empty Trash," Google's explicit dialog box states: *"The item will be permanently deleted and CANNOT BE RECOVERED LATER. This action cannot be undone."*

Intentional Misleading: If the recovery robot exists and can bring files back for 25-30 days, this message should truthfully state: *"The file is removed from the trash, but for security reasons, it can still be restored via the recovery tool for 30 days."* But they don't write that. They deliberately create the illusion that your access to the data has been permanently and irreversibly destroyed.

When Google tries to defend itself by claiming they adequately inform users about data processing under GDPR, I will simply slam this screenshot on the table. With this prompt, Google guarantees me in writing an irreversible destruction, while in the background—as I have proven—they retain both the key (JSON) and the safe (Prompt). This is the very definition of a visual lie designed to deceive the consumer.

Legal and Technical Posture (My Defense)

Notice to the Legal Department of Google LLC and Relevant Judicial/Data Protection Authorities:

Before Google's legal team begins generating standard corporate boilerplate attempting to label this as a simple "glitch," "delayed synchronization," or asserting that developer environments hold special "B2B exemptions" under their Terms of Service, let me lay out the indisputable technical and legal realities. All corporate loopholes have already been preemptively sealed by the weight of my forensic evidence and Google's own admissions.

Here are the 5 core pillars proving systematic and intentional violation of the GDPR:

1. Terms of Service Do Not Trump the GDPR (There is No Developer Exemption)

Google might argue that AI Studio is a developer product governed by separate API terms of service. But the GDPR governs natural persons, and user prompts and contexts classify as personal data. European Union data protection regulations—especially Article 17 (Right to Erasure)—completely overrule any arbitrary, 40-page EULA or ToS. My rights as a data subject cannot be contracted away with a click-through disclaimer.

2. The Buganizer Smoking Gun (Intended Behavior)

I do not need to fight to prove whether this is a code architecture failure or a software bug. Google's own Security VRP (Vulnerability Reward Program) team graciously did the work for me on issue tracker #552682596. They wrote:

"This applies even if the data persists on our backend systems in a way that allows for recovery by the legitimate owner. Status: Won't Fix (Intended Behavior)."

In assessing this from a security perspective, Google formally detached privacy from security. Their security engineers officially admitted in writing that the storage of explicitly deleted data on the backend is an intentional design feature, not a mistake. Before a judge, this nullifies the "accidental software glitch" defense. Google made a conscious, engineering decision to override the user's deletion request.

3. The Unbreakable "UI Placebo" Fraud

I hold time-stamped, irrefutable video forensics exposing how Google lies to the data subject's face.

-

In AI Studio, it says: "permanently deleted after 30 days."

-

When emptying the Google Drive Trash, it explicitly warns: "permanently deleted, and cannot be restored later. The operation cannot be undone." Yet, right after this "guarantee," I effortlessly resurrect the "permanently destroyed" JSON using the official Drive File Recovery robot, which reconnects flawlessly with the server, pulling down 100% of my "deleted" conversational data. Ergo, the UI is an engineered visual deception functioning to make users falsely believe their erasure rights have been executed.

4. Technical Reality: The Illusion of "Eventual Consistency"

Cloud tech companies love to hide behind "eventual consistency," arguing that large distributed systems just need a few days or weeks to "sweep up"

orphaned server data. My testing shattered this defense. The Drive-side JSON file acts purely as a UI pointer containing the interaction_id. Trashing that pointer on the front-end sends *ZERO Cascade Deletion or Drop commands* to the server-side backend storage. There is no automated trash collector that cleans it up after 1 day (despite what the API Docs claim for the free tier). No server logic tells the backend that the UI deleted the pointer. Therefore, my prompts live as "immortal orphans" on Google's cloud—permanently violating Article 17.

5. Reversal of the Burden of Proof & Forensic Auditing

Under the European framework (GDPR Article 5(2) - Accountability Principle), it is no longer my job to poke blindly in the dark for internal server architecture. I have laid down the forensic evidence. It is now up to Google to produce court-certified backend server logs demonstrating exactly when and where a DROP transaction executed on their storage for my interaction_id upon my deletion request. They cannot—because their own VRP explicitly confirmed the data "persists on the backend." If Google attempts to obstruct a court-mandated IT forensic audit or refuses to surrender the true transaction logs, they commit spoliation of evidence, immediately forfeiting the civil case.

Summary:

They violated GDPR Article 17. They admitted in writing that they did it intentionally. Their visual UI elements demonstrably lie about the nature of the data's permanence. The foundation is set—the only thing Google's lawyers can do now is sit in court and read their own developers' confessions aloud.

Subject: Re: Issue 552682596 – Formal Notice Regarding "TRIAGED" Status and Admission of Defect

Dear Google Security, Engineering, and Legal Teams,

I officially note the most recent internal status update classifying this issue as *"TRIAGED."*

Let us be entirely clear about the undeniable legal and technical implications of this status shift:

1. The Ultimate Admission of Guilt:

By overriding the original assessment of "Won't Fix - Intended Behavior" (Comment

#3) and officially Triaging this issue for engineering action, Google has formally conceded my central claim. You have acknowledged that decoupling the frontend UI "Delete" mechanism from the backend server data is an actionable structural defect that requires immediate remediation, not a legitimate feature. Your initial defense is now officially void.

2. A Delayed Patch Does Not Erase Retroactive Liability:

While I welcome the sudden internal realization that your cloud architecture actively breaches GDPR Article 17, I must remind the Google Legal Department of a basic legal reality: fixing a systemic data fraud today does not grant retroactive immunity. For months, Google subjected users to the "Double Deception" (lying about irreversible erasure on the UI while silently maintaining "immortal" interaction pointers on your backend servers). My data, along with countless others', was illegally hoarded and actively withheld.

3. The Evidentiary Chain is Sealed:

We now have a perfect timeline logged on your own systems and across immutable web archives worldwide:

-

First, your documentation lied about an automatic 1-day TTL for the Free tier.

-

Then, your VRP team explicitly admitted the data persists on your backend "intentionally."

-

Now, you silently transition to "Triaged" damage control, scrambling to fix the exact UI Placebo fraud I exposed with my unedited forensic video tests.

To the Google Legal Department: Attempting to quietly deploy a background patch and closing the ticket while burying the underlying GDPR compliance

violation is not a valid strategy.

The clock on the formal notice sent to the Google Ireland DPO is rapidly winding down. You have validated and verified my forensic findings. The civil litigation and the DPC/NOYB investigation are supported by an unbreakable chain of your own contradictory admissions.

If Google wishes to contain the public and financial damage of this European-wide data retention breach, you must instruct your Legal division to initiate direct, formal out-of-court settlement discussions immediately before the 14-day deadline expires.

Do not try to sweep this under the rug with a quick patch. You verified the flaw—now prepare to face the consequences.

Sincerely,
György Istókovics (Bitu79)

Aug 31, 2026 08:52PM ⋮

Please note that the application of 'TRIAGED' status to this report on August 26, 2026, constitutes formal internal replication and technical validation of the decoupled backend data retention architecture outlined in this submission. This verification has been forensically preserved and timestamped. For the avoidance of doubt, this case will proceed through formal regulatory and civil litigation channels, independent of the voluntary parameters of the VRP program, unless an out-of-court settlement is reached.

Sep 1, 2026 03:48AM ⋮

Subject: Formal request for status update on

Issue 552682596 Dear Engineering and Legal Teams, The current status of this ticket is TRIAGED. According to the official Google VRP documentation, this status indicates that the security team has already investigated the report, confirmed the technical defect, and initiated the remediation process.

Furthermore, this issue involves a defect that has been formally acknowledged by

Google developers since 2025 (e.g., Siva_Sravana_Kumar_N confirming: "I was able to replicate the same").

<https://discuss.ai.google.dev/t/deleted-chats-remain-accessible-via-direct-url-in-google-ai-studio/79557>

. This is the archive of that post on archive ph: <https://archive.ph/Kuhcm> My recent documentation of ~20 chat sessions successfully resumed after permanent

deletion further confirms that this systemic failure remains unaddressed.

Given

that this ticket has reached the TRIAGED state and that the underlying data retention fraud has been forensically documented and reproduced, I am formally

requesting a concrete status update regarding the following: What specific engineering steps are being taken to remediate the backend interaction storage

to ensure compliance with the stated deletion/retention policies? When can I expect a resolution, given that this issue has been actively acknowledged by Google-side developers for over a year? Since this matter involves a direct conflict between the promised deletion behavior and the actual backend persistence, I am requesting a formal response from the Legal/Privacy team regarding the compliance of this architecture with GDPR Article 17. I await your

prompt response regarding the remediation timeline. Sincerely, György Istókovics

*Subject: Final Notice: Formal Demand for Settlement Regarding Issue
552682596*

Dear Engineering and Legal Teams,

The status of this report is *TRIAGED*. This status is not a mere suggestion; it is a formal acknowledgment within your own internal infrastructure that the technical defect I have documented is valid, reproducible, and has been actively investigated by your security engineers.

Let there be no misunderstanding regarding the next steps:

1.

The Burden of Proof is Shifted: With the technical defect verified and the internal admission (as documented in your initial "Intended Behavior" response) that user data persists on your backend systems after an explicit erasure request, you have established the evidentiary basis for a civil lawsuit. In a court of law, you cannot deny that this architectural functionality exists.

2.

"Triaged" is your own admission of the defect: By moving this to *TRIAGED*, your engineering team has confirmed that the behavior is a technical failure requiring remediation, not a user error. You cannot present a defense in court that this is a "non-issue" when your own internal systems classify it as a vulnerability that necessitates an impact assessment.

3.

The Final Opportunity: I have provided an airtight chain of evidence, including your own developer documentation, official Google-side replications of the issue (from 2025 to the present), and my own forensic reproductions involving ~20 chat sessions.

This matter is no longer about a "bug bounty." It is about systematic data fraud and a documented breach of GDPR Article 17.

If you wish to avoid a public civil trial and the resulting regulatory scrutiny, your Legal Department must initiate formal out-of-court settlement discussions immediately before my 14-day pre-litigation deadline expires.

The evidence is logged, archived, and ready for the courtroom. I am waiting for your contact.

Sincerely,
György Istókovics

Subject: FINAL NOTICE: Formal Demand for Immediate Escalation to Legal Department

Dear Engineering and Legal Teams,

The current status of this ticket is *TRIAGED*.

Let this be my final notification regarding the systematic GDPR Article 17 violations I have forensically documented. The masking of the executing engineer's email address within this ticket is unlawful, as it intentionally deprives me of identifying the individual responsible for this non-compliance.

I hereby demand the immediate escalation of this issue to Google's Legal and DPO departments.

If a formal response and a concrete resolution plan are not filed directly into this ticket within the established deadline, I will name the responsible parties personally as co-defendants in the upcoming civil litigation for executing compliance fraud and failing to respond on behalf of the corporation.

Understand this clearly: the entire VRP platform is currently exposed as a legal illusion—a corporate facade designed to circumvent mandatory European data protection regulations. Should you fail to resolve this matter, I will ensure this systematic deception is brought to light globally. I am prepared to initiate a massive public disclosure of this fraud, turning this technical failure into a global reputational scandal for Google.

This systemic deception will be integrated into the lawsuit as a primary exhibit. You have been formally notified.

See you in court.

Sincerely,

György Istókovics

To the executing engineer in this ticket (kl...@google.com):

Since I am sending this directly into the ticket via email as usual, you cannot hide behind the corporate shield. I am a human being, not an animal, and I will not let you treat me like garbage or ignore me by hiding behind your automated systems.

You are a direct, conscious accomplice in this data fraud. If you do not answer this ticket directly with a formal compliance plan, I am going to sue you personally as a co-defendant in court. The corporation will not protect you from the legal consequences of your actions.

This entire IssueTracker system is a joke! A corporate fraud. What is it even good for? Absolutely nothing, fuck you. I will have you put in prison if you do not escalate this matter to the legal department immediately. I already sent you registered letters with return receipts back in April and May, which you signed. The return receipts came back to me, so you are totally fucked. I am not joking, you are going to be fucking destroyed over this if you do not contact me urgently. This is not child's play, you idiots! I have uploaded the return receipt of the letter, take a look at it, you dumbasses!

Subject: Formal Objection to P4 Classification – Evidence of Corporate Bad Faith

To the assigned team and Google Legal,

Assigning a "P4" (minor/cosmetic) priority to a documented, systemic GDPR Article 17 violation is a transparent corporate downgrade and deliberate trivialization.

This ticket is officially TRIAGED and ASSIGNED, meaning the persistent backend data retention has been successfully reproduced and verified on your end. Slapping a "P4" label on it does not change the legal reality.

First, you ignored the reports. Then, your security team dismissed this illegal data retention as "Intended Behavior." Now, after forced escalation, you attempt to hide a structural data retention fraud—affecting millions of users—behind the guise of a low-priority software bug, while continuing to refuse direct communication.

Google seems to think users are idiots. You are caught red-handed retaining data that users explicitly deleted. This deliberate downgrading to P4 will be presented directly to the data protection authorities (DPC, NOYB) as

definitive proof of corporate bad faith and willful negligence. I expect a formal legal and compliance response, not just administrative label-shuffling.

<buganizer-system@google.com> ezt írta (időpont: 2026. szept. 2., Sze 16:57):

[- Show quoted text -](#)

György Istókovichs <istokovicsgyorgy79@gmail.com> [#45](#)

Sep 3, 2026 12:53PM ⋮

BINGO! Checkmate Again. You Just Documented Your Own Willful Infringement!

Google engineers really outdid themselves this time. By setting the ticket status to TRIAGED and assigning it a P4 priority at the same time, you have created a massive, catastrophic logical contradiction in your own system. Let's look at Google's official Issue Tracker documentation to see why you completely screwed yourselves with this move:

1. TRIAGED means REPRODUCED & CONFIRMED: According to Google's own rules, a ticket only gets the TRIAGED status after engineers have officially reviewed the evidence, tested the issue, and successfully reproduced it. By marking it Triaged, Google has officially and legally signed off on the fact that the systemic data retention fraud is real, active, and proven. You confirmed that the backend (API Storage) is keeping our deleted chats.
2. P4 means EVENTUAL (i.e., "If we ever feel like it"): Google's official documentation explicitly defines P4 priority as "Eventual". It means you have no deadline, no urgency, and you are pushing the fix to the bottom of the backlog to be ignored indefinitely.

Why TRIAGED and P4 Completely Destroy Google's Legal Defense:

These two statuses completely contradict each other, and together they serve as the ultimate smoking gun of bad faith:

- The Triaged status proves KNOWLEDGE: You cannot claim you didn't know about the GDPR Article 17 violation. You reproduced it. You confirmed it.
- The P4 status proves WILLFUL INTENT: By assigning a proven, ongoing global privacy violation to "Eventual" priority, Google has officially put it in writing that you have no intention of stopping this illegal data hoarding anytime soon. You are actively choosing to maintain a known, law-breaking architecture.

In a data protection court or before a regulator, you can't label a confirmed, active illegal data retention system as "Eventual" just because it's a complex backend task. If you know you are breaking the law (Triaged) but decide you'll fix it whenever you feel like it (P4), that is the textbook definition of willful, continuous corporate fraud. You can't hide behind a P4 label when your own system admits you caught yourselves red-handed! 🎨

György Istókovics <istokovicsgyorgy79@gmail.com> ezt írta (időpont: 2026. szept. 3., Csü 11:39):

- Show quoted text -

György Istókovics <istokovicsgyorgy79@gmail.com> [#46](#)

Sep 3, 2026 01:49PM ⋮

BINGO! Checkmate again. This is not a privacy bug, this is intentional corporate fraud! :rofl:

Google's engineers have just exposed the entire company in their own Issue Tracker. Don't even dare to lie to the authorities that this is just an unfortunate "privacy glitch" or a software bug. By simultaneously setting the ticket to TRIAGED, the priority to P4 (Eventual), and the severity to S4 (Minimal Impact), you have recorded the proof of your offense directly into your own internal system.

Let's look at Google's official Issue Tracker documentation to see why you just lost the game:

TRIAGED proves KNOWLEDGE: Your engineers reviewed, tested, and reproduced the problem. You know exactly that the data and chats you claim are deleted are sitting completely intact on your backend servers (API Storage).

P4 and S4 prove WILLFUL INTENT: By classifying a confirmed, global, years-long violation of GDPR Article 17 (Right to Erasure)—affecting millions—as having a "Minimal Impact" (S4) and indefinitely postponing its fix (P4), Google has officially put it in writing that it deliberately and systematically maintains a law-breaking architecture.

In front of a data protection court or the Irish DPC, you won't be able to sell the story that this is just an accidental "bug." A bug means you

didn't know about it. But you DO know about it (Triaged), and you have officially decided that you don't care (S4) and won't fix it immediately (P4).

This is not a software bug; it is the textbook definition of willful, continuous, systemic corporate fraud and data theft. You caught yourselves red-handed, and you issued the ultimate evidence yourselves in your own system! :rofl:

THE UI BUTTON DECEPTION: PROMPTS ARE NEVER IN GOOGLE DRIVE TRASH

Look closely at Google's own user interface dialogs:

1. Google AI Studio claims: "Move prompt to trash... Your prompt will be permanently deleted after 30 days."
2. Google Drive claims upon permanent deletion: "The item will be permanently deleted and cannot be recovered later. This action cannot be undone."

Here is the undeniable technical contradiction:

PROMPTS AND CONVERSATIONS ARE NEVER STORED IN GOOGLE DRIVE TRASH IN

THE FIRST PLACE.

Only the tiny client-side JSON pointer/metadata file is moved to Google Drive Trash. The actual prompt, full conversation history, and model states reside exclusively on Google's backend servers (API Storage).

The UI deliberately deceives the user into believing that the "prompt" itself is being placed into the trash and destroyed, while in reality, the backend data is never touched or purged by the Drive Trash action.

Slapping a "P4" (Eventual / Lowest Priority) and "S4" (Minimal Impact) rating onto Issue #552682596 while the UI actively misrepresents where and how prompts are deleted is textbook corporate bad faith: Google officially verified the defect (TRIAGED), knows the deletion dialogs are factually misleading, and deliberately chooses to leave this deceptive architecture active!

Title: GOOGLE'S COMPLETE COLLAPSE: How I Will Win a Global GDPR Lawsuit Alone, Without a Lawyer or IT Experts!

It's time to set the record straight, because Google has been lying and spreading bullshit across all platforms for months. But today, they have officially collapsed under their own insanity. I have proven a rock-solid, systemic data theft architecture, and Google's internal logic has shattered completely.

Here are the hard facts of why they have already lost this lawsuit before it even starts:

1. The Blatant Lies of the UI Buttons

The buttons on their user interface lie directly to users' faces.

- The AI Studio button claims: *"Move prompt to trash... Your prompt will be permanently deleted after 30 days."*
- Google Drive Trash guarantees upon emptying: *"The item will be permanently deleted and cannot be recovered later. This action cannot be undone."*

This is a massive lie on both platforms! The prompts and chats never in their entire miserable existence ever set foot inside the Google Drive Trash!

2. The Technical Reality (The JSON vs. PROMPT Scam)

What Google actually does is an arrogant illusion:

- The JSON: Is merely a tiny, technical pointer file that Google hides in the Drive trash.
 - The PROMPT/CHAT: The actual conversational content and your private data, residing on Google's backend API servers.
- Pressing "Delete" never deletes a single thing from their backend databases. They just hide the pointer. Your private data remains permanently stuck on their servers without any deletion command ever being executed.

3. The Babbling Robot and The Corporate Panic

When I exposed this in the bug ticket, their VRP robot spat out an empty, automated reply ([Comment #3](#)). This clueless bot started babbling blindly about their internal "intended behavior" rules and file recovery policies, trying to completely derail the topic and gaslight me. The robot had absolutely no understanding of the underlying backend architecture or the UI lies.

But using my own method—running the official recovery bot—I proved that my backend server data remained fully intact the entire time. When faced with this undeniable proof, Google completely panicked. They tried to desperately cover it up by closing the ticket, and then, completely cornered by the evidence, hastily reopened it in full panic mode (TRIAGED and ASSIGNED)!

THE FATAL DOWNFALL

Google has completely failed. The chain of evidence is locked. I don't need any overpriced lawyers, nor do I need a forensic IT expert to prove this. I will crush them in court all by myself. Their overpaid corporate lawyers will stand there babbling and stammering like monkeys when I show the judge exactly how their interface guarantees destruction, while in reality, they systemically hoard and steal the data of millions of users in the background.

Checkmate. See you in the courtroom!

If there were a real deletion, the backend would actually execute it. The truth is that the buttons are lying, and the backend never receives a deletion command. This is not a bug; it is intentional corporate fraud.

Formal Objection: Procedural Contradiction, Pretextual Closure, and Spoliation of Audit Records ([Issue 557281747](#))

Re: [Comment #13](#) by [vi...@google.com](#)

This closure is a flagrant procedural and logical contradiction that constitutes an open admission of bad-faith corporate evasion.

According to standard software engineering and legal compliance workflows, jurisdictional and component verification must strictly precede any substantive review. If this ticket were genuinely "not related to Google Workspace APIs" or lodged in the wrong component, it should have been redirected immediately without dynamic modification.

Instead, the official system logs document the following irrefutable,

chronological facts:

1.

Substantive Review Preceded the Jurisdictional Disclaimer (18:34 UTC):

Google accepted the report, officially assigned it to an engineer, and at 18:34 actively conducted a substantive technical evaluation, *altering its parameters and downgrading the Severity from S2 to S3*. Modifying the severity level is an explicit technical determination. An engineering team cannot evaluate and alter the severity of a defect over which it claims to have no jurisdiction.

2.

Abrupt Reversal and Pretextual Dismissal (21:55 UTC):

Just 3 hours and 21 minutes later, Google executed an abrupt reversal, closing the ticket as "Obsolete" under the pretext of an incorrect component. An engineering team cannot substantively evaluate a bug, recalibrate its severity, and then claim a lack of jurisdiction three hours later.

3.

The "Obsolete" Classification is Factually False:

The reported defect—server-side data retention in Google AI Studio / Gemini following permanent deletion and trash emptying—affects active, flagship production systems. Designating an active, reproducible compliance failure on live systems as "Obsolete" is technically absurd and represents an arbitrary administrative maneuver to force-close the ticket.

4.

Direct Contradiction with Parallel Validated Tickets:

This administrative manipulation is further exposed by the fact that the exact same data-purging defect is officially validated, reproduced, and marked as *TRIAGED* by Google's vulnerability teams under Issue 552682596. Attempting to dismiss the exact same defect here as an "Obsolete" component mismatch demonstrates severe internal bad faith.

This dynamic pretextual dismissal and the chronological contradiction between the substantive severity downgrade and the abrupt closure have been permanently locked into the evidentiary chain. These records will be submitted directly to NOYB, the European Data Protection Authorities (DPC/NAIH), and the competent court under GDPR Article 79 as physical evidence of intentional non-compliance and procedural evasion.

The evidentiary chain is locked. This ticket remains an active exhibit of bad-faith tracking spoliation.

Sep 8, 2026 05:28AM ⋮

Addendum: Procedural Bad Faith — External Reporters Cannot Be Burdened with Google's Internal Component Taxonomy

Dismissing a documented compliance failure because an external user allegedly filed under the "wrong component" is procedurally absurd and legally untenable.

1. External Users Are Not Google Employees:

External researchers, developers, and citizens reporting GDPR Article 17 violations are not internal Google personnel. It is not the reporter's responsibility to possess insider knowledge of Google's fragmented, opaque

internal organizational silos or arbitrary component hierarchies.

2. The Duty of Intake and Internal Routing Rests with the Controller:

Google operates the public IssueTracker. When a severe defect is reported regarding an active Google product (AI Studio / Gemini), the legal and professional obligation to route the ticket to the appropriate internal engineering team rests entirely upon Google LLC as the Data Controller.

3. A Pattern of Institutional Obstruction:

Expecting external users to guess internal filing codes—while simultaneously

failing to provide a dedicated public Gemini category, and stating across

Cloud Support (Ticket 75129297) that staff "have no capability to escalate"—demonstrates a coordinated corporate strategy to deflect compliance defects by exploiting artificial administrative boundaries.

A public reporter's obligation ends at providing reproducible technical evidence. The controller's obligation begins at proper intake and internal routing. Hiding behind component codes to evade GDPR Article 17

accountability
is documented bad faith.

Formal Notice: Unified Controller Liability – Systemic Evasion Across Corporate Silos Proves Absence of Human Review (GDPR Articles 5(2), 12, and 22)

The coordinated pattern of administrative dismissals across Google's various intake channels demonstrates an institutionalized failure to maintain lawful compliance mechanisms:

1.

Google is a Single, Indivisible Data Controller:

Under European Union law (GDPR), Google LLC / Google Ireland Ltd. operates as a single, unified Data Controller. The company cannot legally evade statutory accountability by disclaiming competence across fragmented internal silos (Cloud Support, Workspace DevRel, Security VRP, or DPO channels).

2.

The Rigid Pattern of Robotic Deflection:

Every single channel contacted exhibits the exact same automated behavior: declaring the issue "out of scope," disclaiming any capability to route or escalate the defect, and summarily closing the ticket without substantive resolution:

-

IssueTracker (Workspace): „Not related to Workspace APIs"

→

Closed without re-routing.

-

Cloud Support (Ticket 75129297): „Strictly out of scope... no authority or capability to escalate"

→

Closed without re-routing.

-

Security VRP: „Intended Behavior"

→

Closed without remediation.

3.

Evidence of Pure Automation (GDPR Article 22):

This rigid, uncoordinated refusal to handle an active, proven data retention failure on live production systems is the hallmark of scripted, algorithmic queue-clearing. A human engineering or legal apparatus would route a verified defect to the appropriate team; an automated "Robot Wall" simply closes tickets based on rigid component filters.

This cross-departmental record of systematic refusal to intake, route, or substantively review a GDPR Article 17 violation has been permanently archived and will be submitted directly to the competent court under GDPR Article 79 as proof of structural non-compliance.

Legal and Technical Refutation of Google's "Data Retention / Disaster Recovery" Defense Google's anticipated defense—that retaining deleted data in the background is a deliberate safety feature for recoverability—collapses completely when scrutinized under the General Data Protection Regulation (GDPR) and the technical guidelines of the European Data Protection Board (EDPB). I. The Relevant Legal Framework (GDPR)

1. GDPR Article 17(1) – Right to Erasure ('Right to be Forgotten'): "The data subject shall have the right to obtain from the controller the erasure of personal data concerning him or her without undue delay..." Legal Meaning: Erasure cannot merely mean hiding the data or making it invisible on the frontend (Soft Delete). At a technical level, the controller must execute a process that permanently prevents the future restoration and active processing of the data.
2. GDPR Article 5(1)(b) and (e) – Purpose Limitation and Storage Limitation: "Personal data shall be kept in a form which permits identification of data subjects for no longer than is necessary for the purposes for which the personal data are processed..." Legal Meaning: Once the user terminates the purpose (by explicitly deleting the chat), the data must be completely removed from daily, active production environments. II. Why Google's "Retention" Defense Fails Legally and Technically In internal VRP communications, Google defends this practice by stating it is "Intended Behavior" and that data "persists on our backend" so legitimate owners can recover it. This defense fails on the following three legal-technical grounds:
3. The Lack of Strict Restriction and Isolation (The "Uninterrupted Execution" Paradox) While the GDPR and EDPB guidelines allow a company to temporarily retain deleted data in backup cycles for legitimate security purposes, the law strictly requires that the data must be "Put Beyond Use." The Legal Requirement: During the retention period, the data must sit in a passive, encrypted archive (cold storage). Live production software (like the active Gemini AI model) must not have direct, functional access to it. The Proven Failure: My forensic testing proves that days after emptying the Trash, simply restoring a tiny client-side .json pointer file from Google Drive causes the chat session to resume instantly and seamlessly with the backend server. Quarantined, backed-up data does not respond in milliseconds. This is physical proof that Google never restricted, isolated, or locked the data; they left it in an active, online database ("hot storage"). If the operational link was never severed, from a data protection standpoint, no legal erasure took place.
4. Intentional Deception and Breach of Transparency (GDPR Article 12) GDPR Article 12 mandates concise, transparent, and truthful communication. The software UI must accurately reflect technical reality. The Proven Failure: Google Drive's own Activity Log explicitly confirms to the user: "Permanently deleted an item." Lying about permanent destruction on official system logs while internally admitting that the data is intentionally kept actively accessible in the backend constitutes deliberate misinformation, a Deceptive Design (Dark Pattern), and bad-faith data processing. Google cannot legitimize a deceptive soft-delete as a "security feature" when its own UI officially denies the existence of that very feature.
5. Bypassing the Documented 1-Day TTL Promise The official Gemini API developer documentation explicitly guarantees a 1-day (24-hour) Time-To-Live (TTL) auto-purge mechanism for Free Tier interactions. The Proven Failure: If the technical documentation promises a 1-day destruction cycle, yet their internal systems (evidenced by the 55-day AI Studio setting and the ability to restore live sessions days later) actively retain those sessions, Google is committing a breach of contract and intentional corporate deception. Conclusion: Google is not executing a deletion or a secure backup

procedure; they are executing a "Placebo Deletion" designed to unlawfully retain active access to user data on production servers.

Google's AI Studio "Delete" is a 3-layer fraud. Paid users are being scammed on retention.

Please read the architectural breakdown before commenting. I have spent a year documenting a systemic data retention fraud (CWE-459) inside Google AI Studio and Google Drive. I have the screenshots, the server logs, and the VRP admission (IssueTracker ID: 564680465) where Google auto-banned me in 60 seconds and explicitly labeled this fraud as "Intended Behavior."

Google is running a 3-Layer Deception Architecture:

Strike 1: The UI "Placebo" (The Illusion) When you click "Permanent Delete" in AI Studio, the UI warns you the data is irreversibly destroyed. This is a lie. The backend database receives ZERO deletion flags. The system merely moves a client-side .json pointer file into your Google Drive Trash. The chat vanishes from your screen, giving you the illusion of privacy.

Strike 2: The Backend Zombie (The Recovery Robot) If you empty your Drive trash, the .json pointer is gone, and the UI says "Chat not found." But the backend "hot storage" (Interactions API) was never touched! If you use Google's official Drive Recovery Tool to resurrect that discarded .json pointer weeks later, the AI Studio interface instantly re-binds to the backend. The "permanently deleted" chat resurrects in milliseconds with 100% of its token history and system prompts.

Strike 3: The Enterprise Financial Scam (The Smoking Gun) In the "Gemini API log settings," Workspace/Enterprise users pay premium fees to set strict, custom data retention policies (e.g., 7 days, 14 days, instead of the 55-day default). But here is the mathematical checkmate: A paying user sets a 7-day retention policy and deletes a chat. They empty the trash. On Day 20 (well past the paid 7-day purge deadline), they use the Drive Recovery tool to restore the JSON pointer. The chat instantly resumes. This is physical proof that the backend NEVER executed the 7-day purge. Google's backend completely ignores the paid TTL settings.

Google is actively charging enterprise customers for data governance and 7-day retention features that their disconnected architecture physically fails to execute. They are hoarding proprietary corporate data indefinitely while selling a "Permanent Deletion" placebo.

The evidence, screenshots of the log settings, and the VRP censorship trail are archived here:
<https://medium.com/@istokovicsgyorgy79>

<https://us1.discourse-cdn.com/spiceworks/original/4X/b/b/9/bb96356a76717b0724eed61c7854820da94c1375.jpeg>

Fun fact: I just submitted the evidence showing that Google also bypasses the PAID retention TTLs (0-day / 7-day limits) for Enterprise customers. The VRP bot closed it in 60 seconds as 'Intended Behavior'. Google just officially admitted in writing that scamming paying Enterprise customers with fake deletion features is a deliberate corporate policy! You can't make this up! 🤪

Sep 23, 2026 02:59AM

Subject: CRITICAL LEGAL NOTICE: Escalation to DPC & NOYB Confirmed — Scope Expanded to Intentional Enterprise Corporate Fraud To the Google Legal Department, Engineering Leads, and Assigned Counsel, Let this comment serve as formal notification that the evidentiary chain has officially closed and the regulatory filing is complete:

1. Regulatory Bodies Officially Served: The full supplementary forensic package—documenting the architectural bypass of paid enterprise retention TTLs, the stateful Interactions API backend persistence, and your VRP team's formal admission of "Intended Behavior" (Ticket #564878654)—has been officially submitted to: The Irish Data Protection Commission (DPC) under active Case Reference: DPC-1-2808-033241-97b448fd-004d-42bd-83a5-ead8b0f9dadd. NOYB (European Center for Digital Rights) for coordinated European enforcement.
2. Legal Scope Officially Expanded to Corporate Fraud: The upcoming civil litigation will no longer be limited to statutory GDPR Article 17 and Article 5 violations. Based on forensic testing proving that Google actively collects premium fees from Enterprise/Workspace clients for custom data retention policies (e.g., 7-day TTL) while the backend consciously ignores them, the court action now

incorporates charges of deliberate, systemic corporate fraud, contractual bad faith (SLA breach), and deceptive trade practices. By officially labeling this persistent backend retention as "Intended Behavior," your own records have documented the mens rea (willful intent) required to establish intentional fraud before a court of law.

3. The Final Window for Out-of-Court Settlement: Understand the procedural reality: Once this lawsuit is formally docketed in court, it becomes an unsealed, permanent public record. At that moment: Any possibility of a confidential out-of-court settlement or NDA is permanently extinguished. The discovery process will mandate the immediate production of internal communications, Slack logs, and backend database audits. The corporate fallout among paying enterprise clients will be irreversible. If Google LLC wishes to avoid a devastating public trial, multi-million-euro statutory fines, and global reputational collapse, your Legal Department must contact me directly and initiate formal, pre-litigation settlement discussions immediately. The countdown is at zero. Either reach out privately to resolve this matter, or we will see each other in front of the judge. Sincerely, György Istókovics (Bitu79) istokovicsgyorgy79@gmail.com
