 STATUS UPDATE No update yet.

 DESCRIPTION György Istókovich created issue [#1](#) Aug 30, 2026 05:34AM ⋮

CRITICAL UPDATE: Systematic Gatekeeping and Unlawful Rejection via Fake Legal/DPO Channels I am submitting official evidence directly into this ticket regarding Google's systematic refusal to process contract and GDPR Article 17 notices. Google's official legal and data protection contact channels: legal-notices@google.com (replies via legal-notices+noreply@google.com) dpo-google@google.com data-protection-office@google.com These channels are operating as deceptive, automated gatekeepers. They are intentionally configured to instantly reject formal legal notices within 1 second using automated rejection templates, claiming no contract exists. Facts of Contract and Identity: I have binding, active contracts with Google under the Google Terms of Service and the Gemini API / AI Studio Additional Terms of Service for my verified Google accounts: istokovicsgyorgy79@gmail.com gabor_gabor@freemail.hu Both accounts are registered Google accounts actively utilizing AI Studio. Under your own Terms of Service and GDPR Article 12/17, you are legally prohibited from ignoring, obstructing, or automatically dismissing contractual breach notices regarding undeleted backend prompts. This issue tracker ticket (#552682596) serves as binding corporate notice. Your automated rejection emails have been fully archived and will be presented in civil court as proof of bad-faith obstruction and intentional non-compliance. I demand a human, legal response to this matter immediately. György Istókovich Accounts: istokovicsgyorgy79@gmail.com gabor_gabor@freemail.hu

Summary of the Issue: Systematic Failure to Purge Backend Data upon User Deletion (GDPR Article 17 Non-Compliance)

****1. Architectural Root Cause: The JSON File is a Pointer, Not the Conversation Object****

****Client-Side Anchor:**** The JSON file saved to Google Drive acts solely as an interface pointer/anchor containing session identifiers ('interaction_id', metadata) used by Google AI Studio to reconnect to the stateful server-side conversation.

****The "Delete" Button Placebo:**** Executing a deletion request in Google AI Studio and emptying the Google Drive trash merely removes the client-side JSON pointer from the user view. The action fails to trigger any cascade deletion command ('DELETE') to

Google's backend storage (Interactions API / Project Storage).

* **Instant Backend Resuscitation:** When the Google Drive File Recovery tool restores the original JSON pointer, AI Studio instantly reads the `interaction\_id` and restores the complete prompt history, model state, and context window directly from Google's active backend storage.

2. Forensic Evidence & Reproducibility:

* **Bulk Retention Test:** ~20 separate chat sessions were deleted in AI Studio, and the Google Drive trash was emptied. 5 days later, the JSON files were restored via Drive File Recovery. Every single chat session, prompt token, and model state instantly reconnected and resumed on Google's servers.

* **Failure of Retention TTL:** Despite developer documentation stating Free Tier interactions are purged automatically after 1 day, the underlying data remained 100% functional and intact after 5 days, proving automatic backend purging is not executed.

3. Direct Contradictions with Google's UI & Official Documentation:

* **Google Drive UI:** Claims emptied trash "cannot be recovered later." *(Factually False).*

* **Google AI Studio UI:** Claims prompts will be "permanently deleted." *(Factually False - backend data remains untouched).*

* **Interactions API Documentation:** Claims users can manage and execute "deletion from project storage in AI Studio." *(Factually False - the UI delete button does not trigger backend storage purging).*

4. The Bugarizer Written Admission (Issue #552682596):

* The Google Security Team officially closed the initial report (#552682596) as "Won't Fix - Intended Behavior," textually certifying that data intentionally "persists on our backend systems in a way that allows for recovery."

* From a GDPR Article 17 (Right to Erasure) standpoint, maintaining orphaned data on backend servers after an explicit deletion request is a willful, systemic violation of European privacy law.

5. Formal Demand:

1. Provide a permanent, verified backend purge (cascade delete) mechanism that physically destroys server-side conversation logs upon user deletion.
2. Cease automated rejection of contractual breach notices sent to Google Legal regarding accounts:
 - `istokovicsgyorgy79@gmail.com`
 - `gabor\_gabor@freemail.hu`

**György Istókovichs** <istokovichsgyorgy79@gmail.com> [#6](#) [Edit](#)Aug 31, 2026 08:31AM 

If Google were to completely shut down the web-based AI Studio right now, they could claim in court that "it was flawed, so we closed it." But because they are forced to keep the web interface open for developers, Google itself ensures that this prompt fraud remains live, testable, and reproducible by anyone at any time. The fact that restoring the JSON key instantly resumes the AI session live, combined with the Issue Tracker stamping it as "Intended Behavior," proves the most flagrant corporate and engineering arrogance and laziness:

- They thought no one would be smart enough: Google's engineers look down on external developers so much that they were convinced no one in the world would ever think of using the Google Drive File Recovery tool to restore an AI Studio JSON file just to see what happens with the backend API. They believed the UI "Delete" button would be more than enough to placate the masses.
- Engineering laziness (Lazy backend): Writing and maintaining genuine session management (which decouples, copies, encrypts, and then purges the pointer) requires extra server capacity and engineering hours. Google simply took the laziest path possible: when the delete button is pressed, the backend does absolutely nothing—it merely hides the file from the user in Google Drive.
- Developer convenience prioritized over data privacy: They left it like this "intentionally" because it is far more convenient for internal engineers if testing sessions are never lost and can be retrieved at any time during troubleshooting. Developer convenience and data retention mattered more to them than complying with the GDPR.

Google not only deceives and hoards data, but they did so in such an incredibly amateurish and lazy manner that a single simple, unedited forensic video and a JSON file was enough to expose their multi-billion-dollar infrastructure.

They didn't implement a fake delete mechanism or exclude AI Studio JSON files from the Drive recovery robot because they never anticipated someone like me coming along who would keep hammering the system until the truth was exposed. Now they are stuck with their own Issue Tracker stamp, and in court, they won't just fail to defend the fraud—they won't even be able to explain away this monumental technical negligence! xD

The "Recovery Defense" is an Admission of Non-Compliance: Google explicitly defended retaining my data by stating it was designed to "allow for recovery by the legitimate owner."*

Under GDPR Article 17, when a user executes a permanent deletion request and empties the trash, the data controller is legally obligated to destroy the data, not hoard it on backend servers under the pretext of "convenient recovery."

By admitting that data persists specifically so it can be resurrected, Google formally admitted that their system deliberately ignores the user's erasure command!

The Legal Trap of the "Empty Trash" Button: Documented Consumer Fraud

Google's lawyers cannot stand in court and claim, *"But the Drive Recovery robot is an official, intended feature to help users,"* while their own User Interface (UI) blatantly lies to your face in bold letters when emptying the trash.

When you click "Empty Trash," Google's explicit dialog box states: *"The item will be permanently deleted and CANNOT BE RECOVERED LATER. This action cannot be undone."*

Intentional Misleading: If the recovery robot exists and can bring files back for 25-30 days, this message should truthfully state: *"The file is removed from the trash, but for security reasons, it can still be restored via the recovery tool for 30 days."* But they don't write that. They deliberately create the illusion that your access to the data has been permanently and irreversibly destroyed.

When Google tries to defend itself by claiming they adequately inform users about data processing under GDPR, I will simply slam this screenshot on the table. With this prompt, Google guarantees me in writing an irreversible destruction, while in the background—as I have proven—they retain both the key (JSON) and the safe (Prompt). This is the very definition of a visual lie designed to deceive the consumer.

Legal and Technical Posture (My Defense)

Notice to the Legal Department of Google LLC and Relevant Judicial/Data Protection Authorities:

Before Google's legal team begins generating standard corporate boilerplate attempting to label this as a simple "glitch," "delayed synchronization," or asserting that developer environments hold special "B2B exemptions" under their Terms of Service, let me lay out the indisputable technical and legal realities. All corporate loopholes have already been preemptively sealed by the weight of my forensic evidence and Google's own admissions.

Here are the 5 core pillars proving systematic and intentional violation of the GDPR:

1. Terms of Service Do Not Trump the GDPR (There is No Developer Exemption)
Google might argue that AI Studio is a developer product governed by separate API terms of service. But the GDPR governs natural persons, and user prompts and contexts classify as personal data. European Union data protection regulations—especially Article 17 (Right to Erasure)—completely overrule any arbitrary, 40-page EULA or ToS. My rights as a data subject cannot be contracted away with a click-through disclaimer.

2. The Buganizer Smoking Gun (Intended Behavior)

I do not need to fight to prove whether this is a code architecture failure or a software bug. Google's own Security VRP (Vulnerability Reward Program) team graciously did the work for me on issue tracker #552682596. They wrote: "This applies even if the data persists on our backend systems in a way that allows for recovery by the legitimate owner. Status: Won't Fix (Intended Behavior)."

In assessing this from a security perspective, Google formally detached privacy from security. Their security engineers officially admitted in writing that the storage of explicitly deleted data on the backend is an intentional design feature, not a mistake. Before a judge, this nullifies the "accidental software glitch" defense. Google made a conscious, engineering decision to override the user's deletion request.

3. The Unbreakable "UI Placebo" Fraud

I hold time-stamped, irrefutable video forensics exposing how Google lies to the data subject's face.

-

In AI Studio, it says: "permanently deleted after 30 days."

-

When emptying the Google Drive Trash, it explicitly warns: "permanently deleted, and cannot be restored later. The operation cannot be undone." Yet, right after this "guarantee," I effortlessly resurrect the "permanently destroyed" JSON using the official Drive File Recovery robot, which reconnects flawlessly with the server, pulling down 100% of my "deleted" conversational data. Ergo, the UI is an engineered visual deception functioning to make users falsely believe their erasure rights have been executed.

4. Technical Reality: The Illusion of "Eventual Consistency"

Cloud tech companies love to hide behind "eventual consistency," arguing that large distributed systems just need a few days or weeks to "sweep up" orphaned server data. My testing shattered this defense. The Drive-side JSON file acts purely as a UI pointer containing the interaction_id. Trashing that pointer on the front-end sends *ZERO Cascade Deletion or Drop commands* to the server-side backend storage. There is no automated trash collector that cleans it up after 1 day (despite what the API Docs claim for the free tier). No server logic tells the backend that the UI deleted the pointer. Therefore, my prompts live as "immortal orphans" on Google's cloud—permanently violating Article 17.

5. Reversal of the Burden of Proof & Forensic Auditing

Under the European framework (GDPR Article 5(2) - Accountability Principle), it is no longer my job to poke blindly in the dark for internal

server architecture. I have laid down the forensic evidence. It is now up to Google to produce court-certified backend server logs demonstrating exactly when and where a DROP transaction executed on their storage for my interaction_id upon my deletion request. They cannot—because their own VRP explicitly confirmed the data "persists on the backend." If Google attempts to obstruct a court-mandated IT forensic audit or refuses to surrender the true transaction logs, they commit spoliation of evidence, immediately forfeiting the civil case.

Summary:

They violated GDPR Article 17. They admitted in writing that they did it intentionally. Their visual UI elements demonstrably lie about the nature of the data's permanence. The foundation is set—the only thing Google's lawyers can do now is sit in court and read their own developers' confessions aloud.

Subject: Re: [Issue 552682596](#) – Formal Notice Regarding "TRIAGED" Status and Admission of Defect

Dear Google Security, Engineering, and Legal Teams,

I officially note the most recent internal status update classifying this issue as *"TRIAGED."*

Let us be entirely clear about the undeniable legal and technical implications of this status shift:

1. The Ultimate Admission of Guilt:

By overriding the original assessment of "Won't Fix - Intended Behavior" (Comment #3) and officially Triaging this issue for engineering action, Google has formally conceded my central claim. You have acknowledged that decoupling the frontend UI "Delete" mechanism from the backend server data is an actionable structural defect that requires immediate remediation, not a

legitimate feature. Your initial defense is now officially void.

2. A Delayed Patch Does Not Erase Retroactive Liability:

While I welcome the sudden internal realization that your cloud architecture actively breaches GDPR Article 17, I must remind the Google Legal Department of a basic legal reality: fixing a systemic data fraud today does not grant retroactive immunity. For months, Google subjected users to the "Double Deception" (lying about irreversible erasure on the UI while silently maintaining "immortal" interaction pointers on your backend servers). My data, along with countless others', was illegally hoarded and actively withheld.

3. The Evidentiary Chain is Sealed:

We now have a perfect timeline logged on your own systems and across immutable web archives worldwide:

-

First, your documentation lied about an automatic 1-day TTL for the Free tier.

-

Then, your VRP team explicitly admitted the data persists on your backend "intentionally."

-

Now, you silently transition to "Triaged" damage control, scrambling to fix the exact UI Placebo fraud I exposed with my unedited forensic video tests.

To the Google Legal Department: Attempting to quietly deploy a background patch and closing the ticket while burying the underlying GDPR compliance violation is not a valid strategy.

The clock on the formal notice sent to the Google Ireland DPO is rapidly winding down. You have validated and verified my forensic findings. The civil litigation and the DPC/NOYB investigation are supported by an unbreakable chain of your own contradictory admissions.

If Google wishes to contain the public and financial damage of this European-wide data retention breach, you must instruct your Legal division to initiate direct, formal out-of-court settlement discussions immediately before the 14-day deadline expires.

Do not try to sweep this under the rug with a quick patch. You verified the flaw—now prepare to face the consequences.

Sincerely,
György Istókovics (Bitu79)

György Istókovichs <istokovicsgyorgy79@gmail.com> ezt írta (időpont: 2026. aug. 31., H, 14:38):

[- Show quoted text -](#)

György Istókovichs <istokovicsgyorgy79@gmail.com> [#12](#) [Edit](#)

Aug 31, 2026 04:59PM

Subject: Re: Formal Notification of Developer Assignment & Pending GDPR Litigation Deadline

Dear Assigned Engineer (pi...@google.com <<https://www.google.com/url?sa=E&q=mailto%3Api...%40google.com>>) and the Google Legal Department,

I see that Google's automated routing (Blunderbuss) has officially transitioned this ticket ([Issue 554464766](#)) from "New" to *"Assigned,"* accurately classifying it as a P2 "Customer Issue" directly addressing "Data retention concerns and GDPR notice processing."

To the assigned Engineering Team:

I welcome your formal involvement. The issue you are assigned to fix is the exact systemic architectural flaw where your "Delete" UI permanently leaves users' interaction_ids and prompt contexts intact and harvestable on your backend, completely defying GDPR Article 17 protocols. Do not attempt a quick band-aid fix on the Drive trash visibility—this is a backend Project Storage / Interactions API structural violation. My unedited forensic video showing the restoration of 20 chats after 5 days, proving your fake server TTLs, has already mapped the exact anatomy of your backend fraud.

To the Google Legal and Privacy Teams:

Let me be extremely clear: an engineer starting work on fixing a long-standing GDPR architecture violation today *does not* erase Google's retroactive legal liability for the past months of illegally hoarding European users' deleted data under the guise of what your own security team formerly called "Intended Behavior."

A patch pushed out tomorrow morning will not cancel my lawsuit.

My strict 14-day pre-litigation ultimatum filed to the Google Ireland Data Protection Officer (DPO) and the Irish Data Protection Commission (DPC), alongside NOYB, is ticking down rapidly. You have officially validated my technical claims through your ongoing internal triaging and this assignment.

You have my contact details. Initiate formal pre-trial settlement discussions before the 14 days run out, or be prepared to stand before an EU judge to explain why a multi-billion dollar company engineered a fake

delete button while actively ignoring explicit GDPR Right to Erasure mandates.

Sincerely,
György Istókovichs (Bitu79)

György Istókovichs <istokovicsgyorgy79@gmail.com> ezt írta (időpont: 2026. aug. 31., H, 16:58):

Sep 9, 2026 10:15AM

Legal and Technical Refutation of Google's "Data Retention / Disaster Recovery" Defense Google's anticipated defense—that retaining deleted data in the background is a deliberate safety feature for recoverability—collapses completely when scrutinized under the General Data Protection Regulation (GDPR) and the technical guidelines of the European Data Protection Board (EDPB). I. The Relevant Legal Framework (GDPR)

1. GDPR Article 17(1) – Right to Erasure ('Right to be Forgotten'): "The data subject shall have the right to obtain from the controller the erasure of personal data concerning him or her without undue delay..." Legal Meaning: Erasure cannot merely mean hiding the data or making it invisible on the frontend (Soft Delete). At a technical level, the controller must execute a process that permanently prevents the future restoration and active processing of the data.
2. GDPR Article 5(1)(b) and (e) – Purpose Limitation and Storage Limitation: "Personal data shall be kept in a form which permits identification of data subjects for no longer than is necessary for the purposes for which the personal data are processed..." Legal Meaning: Once the user terminates the purpose (by explicitly deleting the chat), the data must be completely removed from daily, active production environments. II. Why Google's "Retention" Defense Fails Legally and Technically In internal VRP communications, Google defends this practice by stating it is "Intended Behavior" and that data "persists on our backend" so legitimate owners can recover it. This defense fails on the following three legal-technical grounds:
3. The Lack of Strict Restriction and Isolation (The "Uninterrupted Execution" Paradox) While the GDPR and EDPB guidelines allow a company to temporarily retain deleted data in backup cycles for legitimate security purposes, the law strictly requires that the data must be "Put Beyond Use." The Legal Requirement: During the retention period, the data must sit in a passive, encrypted archive (cold storage). Live production software (like the active Gemini AI model) must not have direct, functional access to it. The Proven Failure: My forensic testing proves that days after emptying the Trash, simply restoring a tiny client-side .json pointer file from Google Drive causes the chat session to resume instantly and seamlessly with the backend server. Quarantined, backed-up data does not respond in milliseconds. This is physical proof that Google never restricted, isolated, or locked the data; they left it in an active, online database ("hot storage"). If the operational link was never severed, from a data protection standpoint, no legal erasure took place.
4. Intentional Deception and Breach of Transparency (GDPR Article 12) GDPR Article 12 mandates concise, transparent, and truthful communication. The software UI must accurately reflect technical reality. The Proven Failure: Google Drive's own Activity Log explicitly confirms to the user: "Permanently deleted an item." Lying about permanent destruction on official system logs while internally admitting that the data is intentionally kept actively accessible in the backend constitutes deliberate misinformation, a Deceptive Design (Dark Pattern), and bad-faith data processing. Google cannot legitimize a deceptive soft-delete as a "security feature" when its own UI officially denies the existence of that very feature.
5. Bypassing the Documented 1-Day TTL Promise The official Gemini API developer documentation explicitly guarantees a 1-day (24-hour) Time-To-Live (TTL) auto-purge mechanism for Free Tier interactions. The Proven Failure: If the technical documentation promises a 1-day destruction cycle, yet their internal systems (evidenced by the 55-day AI Studio setting and the ability to restore live sessions days later) actively retain those sessions, Google is committing a breach of contract and intentional corporate deception. Conclusion: Google is not executing a deletion or a secure backup procedure; they are executing a "Placebo Deletion" designed to unlawfully retain active access to user data on production servers.

Data retention and GDPR compliance are important concerns when users expect their data and formal privacy requests to be handled transparently. Clear documentation, reliable notice-processing procedures, and meaningful human review can help build trust, especially when sensitive information is involved. From a broader financial and compliance perspective, this resource may also be useful:

<https://medium.com/@m.muzamal0342/tax-return-filers-professional-corporation-might-be-the-most-underrated-cpa-firm-in-canada-right-22942824c02a>

György Istókolics <istokovicsgyorgy79@gmail.com> [#15](#) [Edit](#)

Sep 22, 2026 10:47PM 

Google's AI Studio "Delete" is a 3-layer fraud. Paid users are being scammed on retention.

Please read the architectural breakdown before commenting. I have spent a year documenting a systemic data retention fraud (CWE-459) inside Google AI Studio and Google Drive. I have the screenshots, the server logs, and the VRP admission (IssueTracker ID: 564680465) where Google auto-banned me in 60 seconds and explicitly labeled this fraud as "Intended Behavior."

Google is running a 3-Layer Deception Architecture:

Strike 1: The UI "Placebo" (The Illusion) When you click "Permanent Delete" in AI Studio, the UI warns you the data is irreversibly destroyed. This is a lie. The backend database receives ZERO deletion flags. The system merely moves a client-side .json pointer file into your Google Drive Trash. The chat vanishes from your screen, giving you the illusion of privacy.

Strike 2: The Backend Zombie (The Recovery Robot) If you empty your Drive trash, the .json pointer is gone, and the UI says "Chat not found." But the backend "hot storage" (Interactions API) was never touched! If you use Google's official Drive Recovery Tool to resurrect that discarded .json pointer weeks later, the AI Studio interface instantly re-binds to the backend. The "permanently deleted" chat resurrects in milliseconds with 100% of its token history and system prompts.

Strike 3: The Enterprise Financial Scam (The Smoking Gun) In the "Gemini API log settings," Workspace/Enterprise users pay premium fees to set strict, custom data retention policies (e.g., 7 days, 14 days, instead of the 55-day default). But here is the mathematical checkmate: A paying user sets a 7-day retention policy and deletes a chat. They empty the trash. On Day 20 (well past the paid 7-day purge deadline), they use the Drive Recovery tool to restore the JSON pointer. The chat instantly resumes. This is physical proof that the backend NEVER executed the 7-day purge. Google's backend completely ignores the paid TTL settings.

Google is actively charging enterprise customers for data governance and 7-day retention features that their disconnected architecture physically fails to execute. They are hoarding proprietary corporate data indefinitely while selling a "Permanent Deletion" placebo.

The evidence, screenshots of the log settings, and the VRP censorship trail are archived here:
<https://medium.com/@istokovicsgyorgy79>

<https://us1.discourse-cdn.com/spiceworks/original/4X/b/b/9/bb96356a76717b0724eed61c7854820da94c1375.jpeg>

Fun fact: I just submitted the evidence showing that Google also bypasses the PAID retention TTLs (0-day / 7-day limits) for Enterprise customers. The VRP bot closed it in 60 seconds as 'Intended Behavior'. Google just officially admitted in writing that scamming paying Enterprise customers with fake deletion features is a deliberate corporate policy! You can't make this up! 🌈

Subject: CRITICAL LEGAL NOTICE: Escalation to DPC & NOYB Confirmed — Scope Expanded to Intentional Enterprise Corporate Fraud To the Google Legal Department, Engineering Leads, and Assigned Counsel, Let this comment serve as formal notification that the evidentiary chain has officially closed and the regulatory filing is complete:

Regulatory Bodies Officially Served: The full supplementary forensic package—documenting the architectural bypass of paid enterprise retention TTLs, the stateful Interactions API backend persistence, and your VRP team’s formal admission of "Intended Behavior" (Ticket #564878654)—has been officially submitted to: The Irish Data Protection Commission (DPC) under active Case Reference: DPC-1-2808-033241-97b448fd-004d-42bd-83a5-ead8b0f9dadd. NOYB (European Center for Digital Rights) for coordinated European enforcement. Legal Scope Officially Expanded to Corporate Fraud: The upcoming civil litigation will no longer be limited to statutory GDPR Article 17 and Article 5 violations. Based on forensic testing proving that Google actively collects premium fees from Enterprise/Workspace clients for custom data retention policies (e.g., 7-day TTL) while the backend consciously ignores them, the court action now incorporates charges of deliberate, systemic corporate fraud, contractual bad faith (SLA breach), and deceptive trade practices. By officially labeling this persistent backend retention as "Intended Behavior," your own records have documented the mens rea (willful intent) required to establish intentional fraud before a court of law. The Final Window for Out-of-Court Settlement:

Understand the procedural reality: Once this lawsuit is formally docketed in court, it becomes an unsealed, permanent public record. At that moment: Any possibility of a confidential out-of-court settlement or NDA is permanently extinguished. The discovery process will mandate the immediate production of internal communications, Slack logs, and backend database audits. The corporate fallout among paying enterprise clients will be irreversible. If Google LLC wishes to avoid a devastating public trial, multi-million-euro statutory fines, and global reputational collapse, your Legal Department must contact me directly and initiate formal, pre-litigation settlement discussions immediately. The countdown is at zero. Either reach out privately to resolve this matter, or we will see each other in front of the judge. Sincerely, György Istókovics (Bitu79) istokovicsgyorgy79@gmail.com
